Abstract— Recently QinetiQ has been commissioned to undertake several surveys of Critical National Infrastructure (CNI) sites in the UK and the US to evaluate the risk to the sites from Intentional Electromagnetic Interference (IEMI). This paper summarizes some observations from these surveys and our interactions with CNI owners/operators. This paper also compares and contrasts the IEMI threat with Cyber (computer network attacks) and physical threats.

Keywords- IEMI, Electromagnetic Compatibility, Critical National Infrastructure, Cyber

I. INTRODUCTION

Intentional Electromagnetic Interference (IEMI) is of growing concern to Critical National Infrastructure (CNI) asset owners/operators, largely because of the recent expansion in the use of embedded electronic systems for control and diagnostic purposes and the growing availability of capable IEMI sources [1]. New legislative drivers such as the SHIELD ACT in the USA [2] and the perceived risk from Cyber threats are forcing CNI asset owners and operators to consider their vulnerability to these relatively new threats.

A definition of Cyberspace is "an operational domain whose distinctive and unique character is framed by the use of electronics and the electromagnetic spectrum to create, store, modify, exchange and exploit information via interconnected information-communication technology (ICT) based systems and their associated infrastructures" [3]. However, mostly the term Cyber is associated with a rather narrow definition of the threat which can be summarized as Computer Network Attack (CNA), whereby both the source of the threat and the target are ICT based. Examples of CNA include; hacking, malicious software (malware), Denial of Service (DoS) and Distributed Dos (DDoS), Botnets, and network intrusion [4].

Physical threats to the CNI are perhaps more familiar and can include, for example; bombing, arson, and theft.

II. OBSERVATIONS

A summary of observations of the difference in threat perception and protection are given in Table 1. These observations are 'first hand' and were identified from various Technical Visual Assessments (TVAs) of established functional CNI Sites in the UK and the US and of plans and designs for new sites yet to be built. The TVAs were conducted by QinetiQ in the last 24 months.

This paper explores these differences in a higher level of

detail, providing examples where they have been observed.

TABLE I. A SUMMARY OF OBSERVATIONS

Cyber/Physical Threats	IEMI Threats
Most Infrastructure providers/operators have	Very few infrastructure providers presently
an individual(s) responsible for Cyber	acknowledge or recognize the IEMI threat -
Security or 'digital risk' and Physical	therefore they do not generally appoint
Security	someone to be responsible for IEMI protection
Cyber and Physical threats can affect	IEMI is primarily a threat to the availability of
confidentiality, integrity and availability	information/capable of denying service
Cyber exploits can be conducted from	The range of IEMI threat sources can easily
another continent, outside of one Nation's	exceed the physical perimeter of a CNI asset
legal jurisdiction. Physical threats require	but do not have the reach of Cyber threats
physical interaction with the asset	
Cyber is fundamentally a risk to	IEMI can affect all unprotected electronic
interconnected ICT networks. Physical	devices - not just interconnected ICT networks
threats are a risk to physical, tangible assets	and can even affect electronic systems used to
	support physical security
Laws already exist for Cyber-crimes and	Whilst it is illegal to transmit Radio Frequency
Cyber Terrorism. Physical acts on a CNI site	signals without a license in many countries the
are covered by standard legal doctrine	act of procuring and using an IEMI source has
	not been legally tested
The manifestation of a Cyber disturbance	IEMI disturbances can leave very little or no
can be subtle or severe but it is possible to	physical evidence.
recover an evidence trail. Physical threats	
tend to leave physical evidence	
Cyber/Physical Protection	IEMI Protection
A wide variety of standards and guides are	Whilst design rules and standards exist to
available to infrastructure designers to	protect a new-build facility from IEMI, they
improve the physical and Cyber security of	are rarely mandated.
new facilities
