

In this course, we'll cover industrial malware, ransomware, persistent threats, and other types of malicious software in the wild today. The course is online with a two day mid-term meeting for presentations.

Interested in cybersecurity? want to know what these things you hear about really are and how they work? and how nations are using cyber as the newest tool in their toolbox?

ECE 595-003, an Introduction to Cybersecurity will answer these questions for you. In this special 8-week topics course, we'll cover how cyber got to where it is today, and we'll learn how modern campaigns work.

Designed to be accessible for a wide range of students, we'll go over some of the technical details, and you can dive into them if you'd like, but the focus of the course is on how these campaigns are designed, how malware works in the scope of the campaigns, and why malware's used in the first place.
